

The goal of our programs is to simulate a dice rolling game where users can select a number of rolls. Users can roll 1-6.

Features: Invalid input will let the user know, can input a large number, can do math, and determine the winner. Can also continue playing without restarting the program.

I will share all the updates and code files on github, I'm also using Thonny as writing and testing the program. I will save all the data on Github. All code and updates will be shared on GitHub, where members can push changes, share works, and do a collaboration through pull requests. We would like to use any social media platforms that have an online meeting for easier communication. For us the definition of done is when we finish all the procedures and submit the program.
